

Surveillance and Security Camera Cabling

IP Camera Infrastructure

Modern IP cameras connect over standard Ethernet cabling. A 4K camera with H.265 encoding requires approximately 15 Mbps of network bandwidth. For a 90-day retention at 30 frames per second, storage sizing is approximately 4 TB per camera.

- 4K H.265 stream: ~15 Mbps
- 90-day retention: ~4 TB per camera

Analog Coax Upgrade

Existing RG-59 coaxial cable can be reused with IP-over-coax extenders. These devices support up to 100 Mbps over 300 metres of RG-59. Power can be delivered via the coax using point-of-entry injectors.

- IP-over-coax throughput: 100 Mbps
- Maximum distance: 300 m on RG-59

Camera Elevation

General-purpose surveillance cameras should be mounted between 2.7 and 3.6 metres above grade. Entrance cameras for facial recognition require 2.4 to 3.0 metres with a horizontal offset not exceeding 15 degrees from the subject's approach vector.
